

Team JSHD - Meeting 10/25/2021

Touching base

- Minor progress for the get-all endpoint was done, no unit tests yet

Brief blameless post-mortem:

- What goals have been achieved.
 - A github repo is created with our team members for the project
 - We have a node project that is runnable and has a simple test suite
 - Dependencies should be ready to install in one command
 - Running the project takes only one command after dependencies are built
 - Running test suites takes only one command after dependencies are built
 - Project functionality and test coverage is not required for this milestone
 - The project is containerized in Docker
 - Project is hosted on Heroku, deployed with our docker image
 - A readme is provided in top level directory of the repo with instructions on installing and running the project
 - A summary of our tech stack and the relevant decision making
 - Milestones of the project with member ownership of each step
 - Directions to our collection of meeting notes

Why did it go right?

- Had clear responsibilities, which were assigned early.
 - We kept records in meeting notes.
 - Scope was relatively small, and didn't overestimate capacity.
 - Team members helped each other when facing difficulty.
 - Each part of the process had a team member that was familiar with it.
-
- What goals have been missed, and by how much
 - Our original goals were met.
 - What could improve:
 - We crammed meetings towards the end, we should consider regular weekly meetings.
 - Meetings are not structured well, resulting in inefficiencies.
-
- What, if any, adjustments or decisions need to be made in light of what we have learned about project scope and capacity, in particular what plans will need to be adjusted, based on remaining time available and project scope?

- We will have to version the application when we update or delete guidelines, which our partner informed us about later. We don't think this will change our scope or introduce any risks to our plan

Todo: Schedule to meet with Alex between Friday 6-8pm, the weekend, or next Tuesday 5-7pm

Discussed about using unit tests

- Talked about using promises and async/await
- Decided to create another test db so our test suites don't change our app's data
